

PowerLender® Fields

Enter Data Once, Use it Anywhere

Introduction

PowerLender is a business-rules-based loan origination and processing system that can be refined and modified by non-programmers to meet specific needs of mortgage and consumer lenders.

PowerLender users have total control of all aspects of the system - data fields, screens, forms, reports, menus, workflow, audit functions, security and more. PowerLender allows lenders to match and enhance their present operation rather than forcing them to conform to the limitations of the LOS.

Enter Data Once - Use it Anywhere

At the heart of PowerLender's flexibility is its field-based logic. Fields are used to create the inputs, outputs, calculations, audits, etc., that refine PowerLender to the lender's desired method of originating and processing loans.

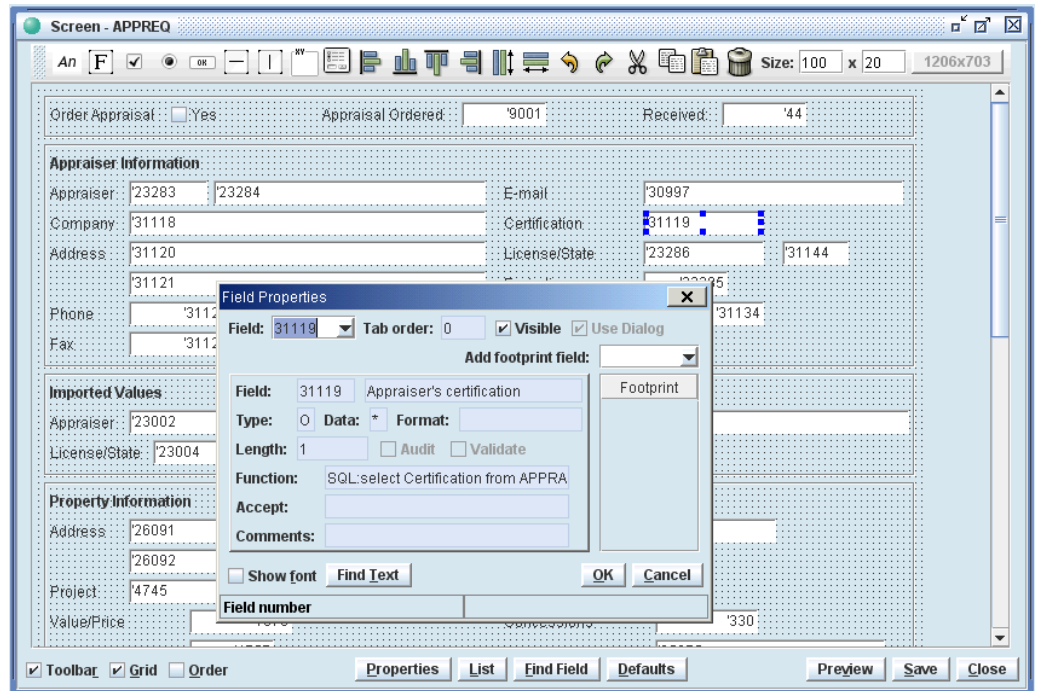

These fields become the data entry masks used to populate input screens.

They are used as outputs to print data onto forms.

They are used to create audits, to make specific, detailed calculations, and to make status reports of any kind.

PowerLender's unique, field-based logic allows for the repeated use of any piece of entered data.

For example, borrower name or address, etc. never has to be rekeyed as field-based logic permits it to be used anywhere it is needed. This not only speeds the lending operation but greatly reduces the errors that inevitably occur when the re-entry of data is required.

Here is a sample image of how to add a field to a screen in PowerLender.

Field-based logic also permits lenders to create or replicate virtually any task or operation, and the built-in Lending Rules Foundation provides a secure base from which to start and build upon.

ASC has been helping lenders grow for more than 30 years by providing quality software and outstanding customer service. If you'd like to know more about PowerLender, please call us at 800-628-4687 or visit www.powerlender.com for more information.
